

ABSTRACT OF THE DISCLOSURE

An object of the present invention is to propose image processing technology
5 whereby even a player with a low skill level can enjoy a shooting game with more
excitement. To achieve this object, according to the present invention, if a player
outputs a slow regeneration request signal when processing transits to the status
where an enemy-character is about to fire a bullet, the enemy-character and the
bullet fired by the enemy-character are regenerated slowly. By this, the player can
10 aim at the bullet with extra time.
